

SPM[®] 2 32 Series Intelligent Power Module (IPM) Interleaved PFC, 650 V, 50 A NFL25065L4BT

The NFL25065L4BT is a Motion SPM 2 module providing a fully-featured, high-performance Interleaved PFC (Power Factor Correction) input power stage for consumer, medical, and industrial applications. These modules integrate optimized gate drive of the built-in IGBTs to minimize EMI and losses, while also providing multiple on-module protection features including under-voltage lockout, over-current shutdown, thermal monitoring, and fault reporting. These modules also feature a full-wave rectifier and high-performance output diodes for additional space savings and mounting convenience.

Features

- UL Certified No. E209024 (UL1557)
- 650 V – 50 A 2-Phase Interleaved PFC with Integral Gate Drivers and Protection
- Very Low Thermal Resistance using Al₂O₃ DBC Substrate
- Low-Loss Field Stop 4th Generation IGBT
- Full-Wave Bridge Rectifier and High-Performance Output SiC Boost Diode
- Optimized for 60 kHz Switching Frequency
- Built-in NTC Thermistor for Temperature Monitoring
- Isolation Rating of 2500 Vrms / 1 min
- These Devices are RoHS Compliant

Typical Applications

- 2-Phase Interleaved PFC Converter (AC 200V Class)
 - ♦ HVAC (Commercial Air-conditioner)

Integrated Power Functions

- 650 V – 50 A 2-Phase Interleaved PFC for Single-phase AC-DC Power Conversion (refer to Figure 2)

Integrated Drive, Protection, and System Control Functions

- For IGBTs: Gate-drive Circuit, Over-Current Protection (OCP) Control Circuit, Under-Voltage Lock-Out Protection (UVLO)
- Fault Signaling: Corresponding to UV and OC faults
- Built-in Thermistor: Temperature Monitoring
- Input Interface: Active-HIGH Interface, works with 3.3 V / 5 V Logic, Schmitt-Trigger Input

MECHANICAL CHARACTERISTICS AND RATINGS

Parameter	Conditions	Value			Unit
		Min	Typ	Max	
Device Flatness	See Figure 5	0	–	150	μm
Mounting Torque	Mounting Screw: M4 (Note 5, 6)	0.78	0.98	1.17	N • m

Weight		–	32	–	g

- Do not over torque when mounting screws. Too much mounting torque may cause DBC cracks, as well as bolts and Al heat-sink destruction.
- Avoid one-sided tightening stress. Uneven mounting can cause the DBC substrate of package to be damaged. The pre-screwing torque is set to 20 ~ 30% of maximum torque rating.

Figure 6. Under-Voltage Protection

- a1: Control supply voltage rises: after the voltage rises UVDDR, the circuits start to operate when the next input is applied.
a2: Normal operation: IGBT ON and carrying current.
a3: Under-voltage detection (UVDDD).
a4: IGBT OFF in spite of control input condition.
a5: Fault output operation starts.
a6: Under-voltage reset (UVDDR).
a7: Normal operation: IGBT ON and carrying current by triggering next signal from LOW to HIGH.

Figure 7. Over-Current Protection

- (With the external over current detection circuit)
b1: Normal operation: IGBT ON and carrying current.
b2: Over-current detection (OC trigger).
b3: All IGBTs gate are hard interrupted.
b4: All IGBTs turn OFF.
b5: Fault output operation starts.
b6: Input LOW – IGBT OFF state.
b7: Input HIGH – IGBT ON state, but during the active period of fault output, the IGBT doesn't turn ON.
b8: IGBT OFF state.

Figure 8. Typical Application Circuit

7. To avoid malfunction, the wiring of each input should be as short as possible (Less than 2 – 3 cm).
8. VFO output is an open-drain type. This signal line should be pulled up to the positive side of the MCU or control power supply with a resistor that makes IFO up to 1 mA.
9. Input signal is active-HIGH type. There is a 5 kΩ resistor inside the IC to pull-down each input signal line to GND. RC coupling circuits should be adopted for the prevention of input signal oscillation. RC coupling at each input might change depending on the PWM control scheme used in the application and the wiring impedance of the application's printed circuit board. R1C1 time constant should be selected in the range 50 ~ 150 ns (Recommended R1 = 100 Ω, C1 = 1 nF).
10. To prevent error of the protection function, the wiring related with R3 and C3 should be as short as possible.
11. In the over-current protection circuit, select the R3C3 time constant in the range 1.5 ~ 2.0 μs. Do enough evaluation on the real system because over-current protection time may vary wiring pattern layout and value of the R3C3 time constant.
12. Each capacitor should be mounted as close to the pins of the Motion SPM 2 product as possible.
13. Relays are used in most systems of electrical equipment in industrial application. In these cases, there should be sufficient distance between the MCU and the relays.
14. The zener diode or transient voltage suppressor should be adapted for the protection of ICs from the surge destruction between each pair of control supply terminals (Recommended zener diode is 22 V / 1 W, which has the lower zener impedance characteristic than about 15 Ω).
15. Please choose the electrolytic capacitor with good temperature characteristic in C2. Choose 0.1 ~ 0.2 μF R-category ceramic capacitors with good temperature and frequency characteristics in C4.
