Silicon Carbide (SiC) Cascode JFET Module - EliteSiC, Full-Bridge Module, 1200 V, 35 mohm

Rev. D, January 2025

Description

This SiC FET device is based on a unique 'cascode' circuit configuration, in which a normally-on SiC JFET is co-packaged with a Si MOSFET to produce a normally-off SiC FET device. The device's silicon-like gate-drive characteristics allows the use of unipolar gate drives, compatible with Si IGBTs, Si FETs, SiC MOSFETs or Si superjunction devices. Available in the E1B module package, this device exhibits ultra-low gate charge and exceptional reverse recovery characteristics, making it ideal for switching inductive loads, and any application requiring standard gate drive. Advanced Ag sintering die attach technology gives the module superior thermal performance.

Features

- ♦ On-resistance: $R_{DS(on)} = 35m\Omega$ (typ)
- ♦ Operating temperature: 150°C (max)
- ♦ Excellent reverse recovery: $Q_{rr} = 244nC$
- ♦ Low body diode voltage: $V_{FSD} = 1.4V$
- ♦ Low gate charge: $Q_G = 42.5nC$
- ♦ Threshold voltage $V_{G(th)}$: 5V (typ) allowing 0 to 15V drive
- ♦ Low intrinsic capacitance
- ♦ ESD protected: HBM class 2 and CDM class C3
- ♦ AECQ Qualified

Typical applications

- ♦ EV charging
- ♦ PV inverters
- ♦ Switch mode power supplies
- ♦ Power factor correction modules
- ♦ Motor drives
- ♦ Induction heating

NOTES:

1. All dimensions in millimeters (mm)
2. General tolerance: $\pm 0.1\text{mm}$, unless otherwise specified

Important Mounting Information

This product is recommended for use with solder pin attach and phase change thermal interface materials, and not recommended for implementations using press fit and application of thermal grease. Please refer to mounting guidelines and user guide documents associated with this product for detailed information.

Applications Information

SiC FETs are enhancement-mode power switches formed by a high-voltage SiC depletion-mode JFET and a low-voltage silicon MOSFET connected in series. The silicon MOSFET serves as the control unit while the SiC JFET provides high voltage blocking in the off state. This combination of devices in a single package provides compatibility with standard gate drivers and offers superior performance in terms of low on-resistance ($R_{DS(on)}$), output capacitance (C_{oss}), gate charge (Q_G), and reverse recovery charge (Q_{rr}) leading to low conduction and switching losses. The SiC FETs also provide excellent reverse conduction capability eliminating the need for an external anti-parallel diode.

Like other high performance power switches, proper PCB layout design to minimize circuit parasitics is strongly recommended due to the high dv/dt and di/dt rates. An external gate resistor is recommended when the FET is working in the diode mode in order to achieve the optimum reverse recovery performance. For more information on SiC FET operation, see <https://www.qorvo.com/innovation/power-solutions/sic-power/sic-fet-design-tips>.

A snubber circuit with a small $R_{(G)}$, or gate resistor, provides better EMI suppression with higher efficiency compared to using a high $R_{(G)}$ value. There is no extra gate delay time when using the snubber circuitry, and a small $R_{(G)}$ will better control both the turn-off $V_{(DS)}$ peak spike and ringing duration, while a high $R_{(G)}$ will damp the peak spike but result in a longer delay time. In addition, the total switching loss when using a snubber circuit is less than using high $R_{(G)}$, while greatly reducing $E_{(OFF)}$ from mid-to-full load range with only a small increase in $E_{(ON)}$. Efficiency will therefore improve with higher load current. For more information on how a snubber circuit will improve overall system performance, visit the Qorvo website at <https://www.qorvo.com/innovation/power-solutions/sic-power/sic-fet-design-tips>.

Introduction

This Manufacturing Note is intended for manufacturing engineers who are currently using the module for prototype or production manufacturing. The information provided in this document is meant to assist customers with the set-up and characterization of their products.

Module Package Description

This module is a SiC FET device based on a unique cascode circuit configuration, in which a normally-on SiC JFET is co-packaged with a Si MOSFET to produce a normally-off SiC FET device. The device's silicon-like gate-drive characteristics allows the use of unipolar gate drives, compatible with Si IGBTs, Si FETs, SiC MOSFETs or Si superjunction devices. Available in the E1B module package, this device exhibits ultra-low gate charge and exceptional reverse recovery characteristics, making it ideal for switching inductive loads, and any application requiring standard gate drive Package Outline Drawing.

Carriers

Tray and Shipping Instructions

The module is placed in an ESD tray with a pocket carrier that holds the module in dead bug orientation. The pocket is designed to hold the module for shipping and for loading onto manufacturing equipment, while protecting the body and the solder pins from damaging stresses with a lid to seal the units firmly. Then trays are placed in a shipping box with desiccant, proper label, and protective packaging so secure the tray firmly prior packing with tape.

The individual tray pocket design and count can vary from vendor to vendor.

Storage and Handling

Storage and Handling Conditions

Excessive forces from shock or vibration as well as environmental factors must be avoided when transporting and handling the modules. Although it is not advised, it is feasible to store the modules at the temperature ranges listed in the datasheet. Furthermore, the modules can be subjected to environmental conditions, see reference below.

IEC 60721-3-1: Classification of environmental conditions.

IEC 60721- 3-2: Classification of groups of environmental parameters and their severities - Transportation and handling/

IEC 60721-3-3 Classification of groups of environmental parameters and their severities – Stationary use at weather protected locations.

ESD

Electrostatic discharge occurs naturally in the environment. With the increase in voltage potential, the outlets of neutralization or discharge will be sought. If the acquired discharge route is through a semiconductor device, destructive damage will result.

ESD countermeasure methods should be developed and used to Control potential ESD damage during handling in a factory environment at each manufacturing site.

This part is considered ESD sensitive and needs to be handled accordingly.

Qorvo recommends using standard ESD precautions (see Reference Documents) when handling these devices.

Reference Documents:

1. JEDEC Standard JESD625-A, "Requirements for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices."
2. ANSI/ESD S20.20, "Protection of Electrical and Electronic Parts, Assemblies and Equipment (Excluding Electrically Initiated Explosive Devices)."

NOTE: The ESD level for this part is documented in the product qualification report that is available from Qorvo.

Buyer is responsible for its products and applications using **onsemi** products, including compliance with all laws, regulations and safety requirements or standards, regardless of any support or applications information provided by **onsemi**. "Typical" parameters which may be provided in **onsemi** data sheets and/or specifications can and do vary in different applications and actual performance may vary over time. All operating parameters, including "Typicals" must be validated for each customer application by customer's technical experts. **onsemi** does not convey any license under any of its intellectual property rights nor the rights of others. **onsemi** products are not designed, intended, or authorized for use as a critical component in life support systems or any FDA Class 3 medical devices or medical devices with a same or similar classification in a foreign jurisdiction or any devices intended for implantation in the human body. Should Buyer purchase or use **onsemi** products for any such unintended or unauthorized application, Buyer shall indemnify and hold **onsemi** and its officers, employees, subsidiaries, affiliates, and distributors harmless against all claims, costs, damages, and expenses, and reasonable attorney fees arising out of, directly or indirectly, any claim of personal injury or death associated with such unintended or unauthorized use, even if such claim alleges that **onsemi** was negligent regarding the design or manufacture of the part. **onsemi** is an Equal Opportunity/Affirmative Action Employer. This literature is subject to all applicable copyright laws and is not for resale in any manner.
